

Figure 1. Percent greensnap from fungicide trials conducted west of Greenwood, MS during the 2012 season. Fungicide applications were made to corn at the V6 growth stage. Percent greensnap is presented as the average of all trials treated with a specific product type and the method of application that was made **A**) without glyphosate or **B**) with glyphosate (as 22 fl oz/A of RoundUp PowerMax) to serve as the adjuvant. All applications were made in 15 gal/A. Pioneer 1187 was the hybrid.
