

Table 1. Fungicides approved in Mississippi for yield loss prevention as a result of soybean rust in 2013. Please note there are some products that are registered but no longer being marketed for soybean rust prevention that are not included on this list. In addition, this list does not include products considered to be "biofungicides" since we have limited data on their efficacy. All generics may likely not be included on this list. Please contact MSU-ES for the registration information pertaining to generics since there may be some that are not currently labeled for use in MS even though they have a federal label.

^yHeadline EC is the old formulation of Headline and may still be available for sale in 2012. Headline SC will take its place in the future.

^wSeveral other products are available on the market with tebuconazole as the active ingredient. Included in MS are Orius 3.6F and TebuStar 3.6L. However, keep in mind that some products have a federal label and may not be labeled for use in all states.

*Chlorothalonil has only limited activity against rust, but only as a topical protectant. Probably should be used in rotation with more effective products.
