

Figure 1. Yield from fungicide trials conducted in Stoneville, MS during the 2012 season. Fungicide applications were made to corn at the V6 growth stage. Yield is presented as the average of all trials treated with a specific product type and the method of application that was made **A**) without glyphosate or **B**) with glyphosate (as 22 fl oz/A of RoundUp PowerMax) to serve as the adjuvant. All applications were made in 15 gal/A. NK N78N was the hybrid.
