**ABSTRACT:** Ninety-five Roundup Ready and thirty-six Conventional/Liberty-Link soybean varieties were evaluated on a Leeper silty clay loam soil at Verona, MS in 2016. The Roundup Ready varieties were evaluated in separate maturity group (MG) studies (MG early IV, MG late IV, MG early V, and MG late V). The Conventional/Liberty-Link varieties were evaluated as MG IV and MG V studies. Rainfall was 88%, 16%, 59%, 21%, 105%, and 3% of normal for April, May, June, July, August, and September, respectively. Only slight lodging and little (less than 2%) or no shattering in most studies was observed at harvest. Seed shatter greater than 2% are noted in all tables. The tables also include 2012 - 2016 yield results where applicable. The overall mean yield for Roundup Ready MG early IV, MG late IV, MG early V, and MG late V studies were 65.0, 63.6, 63.1, and 64.4 bu/ac, respectively. The overall mean yield for the Conventional/Liberty-Link Variety MG IV and MG V Trials were 52.3 and 63.4 bu/ac, respectively. The greatest conventional/Liberty-Link MG IV and MG V variety yield was 62.1 and 71.6 bu/ac, respectively. The greatest yield for Roundup Ready varieties across all maturity groups ranged from 69.4 to 76.7 bu/ac. The early MG IV varieties' yield ranged from 55.3 to 73.1 bu/ac. The late MG IV yield ranged from 53.2 to 71.0 bu/ac. The early MG V yield ranged from 48.9 to 76.7 bu/ac. The late MG V yield ranged from 57.2 to 69.4 bu/ac. The Roundup Ready varieties producing the lowest yield across all studies ranged from 48.9 to 55.3 bu/ac. The Conventional/Liberty-Link MG IV Variety Trial yield ranged from 23.7 to 62.1 bu/ac. The Conventional/Liberty-Link MG V Variety Trial yield ranged from 55.9 to 71.6 bu/ac. When compared to the varieties producing the lowest yield in each study, selecting the most productive variety has the potential to increase yield between 12.2 and 27.8 bu/ac given similar environmental conditions in a given year. In 2016 green stem was more problematic in the Roundup MG late IV varieties and MG IV conventional/Liberty-Link varieties. Some varieties exhibited moderate green stem (see Tables 3 and 6). Cercospora blight (late-season Cercospora; *Cercospora kikuchii*) and frogeye leaf spot (*Cercospora sojina*) were the predominant diseases observed in all varieties planted. However, where present, Septoria brown spot (Septoria; *Septoria glycines*) and target spot (*Corynespora cassiicola*) were also observed in some entries. Variety selection for high yield and appropriate disease resistance is essential for soybean profitability.

**MATERIALS AND METHODS:** Six field studies were conducted in 2016 on a Leeper silty clay loam soil, at the North Mississippi Research and Extension Center, Verona, MS. Roundup tolerant soybean varieties of Maturity Group (MG) early IV, MG late IV, MG early V, and MG late V varieties were evaluated in separate studies. In addition, Conventional/Liberty-Link soybean MG IV and MG V varieties were evaluated separately. All experiments were conducted as randomized complete block designs with four replications. Each plot consisted of two 8-inch twin

rows on 38-inch beds × 20 feet in length. Seed was treated with Vitavax (carboxin) /Thiram (thiram) plus Apron (mefenoxam) fungicides before planting.

Potassium and triple super phosphate at 100 lb/acre each was applied 10/19/15. The entire study area was tilled with the TerraTill (in-row-subsoil-bed-roller) on 10/21/15. A burndown application of Roundup + Sharpen + Dicamba + Battery + methylated seed oil at 32 + 1.5 + 6 + 2 + 16 oz/acre was applied to the study area on 3/21/16. The study area received a pre-emergence application of Gramoxone + Dual II Magnum (metolachlor) + Tricor 70DF (metribuzin) + surfactant at 32 + 20 + 5.3 + 4.8 oz/ac on 4/28/16. The Conventional/Liberty-Link MG IV and MG V were planted 4/22/16 and 5/17/16, respectively. The Roundup Ready early and late MG IV varieties were planted 5/17/16 and 5/16/16, respectively. The Roundup Ready early and late MG V varieties were planted 5/16/16 and 4/27/16, respectively.

The Roundup tolerant varieties received a post-emergence application of Roundup PowerMax + First Rate (cloransulam) at 24 + 0.3 oz/ac on 6/01/16 and repeated applications of Roundup PowerMax at 24 oz/ac on 6/9/16, 6/21/16 and 7/13/16. The Conventional/Liberty-Link studies received a post-emergence application of Section (clethodim) + crop oil at 12 oz/ac (0.1875 lb ai/ac) + 1 pt/ac on 6/01/16, 6/21/16 and 7/07/16 and an application of First Rate + crop oil at 0.3 oz + 19 oz/ac on 6/08/16. Both Conventional/Liberty-Link and Roundup studies received an application of Intrepid + Radiant + Hero + Orthene at 16 oz + 5 oz + 6 oz + 1 lb product/ac was applied 8/18/16.

Variety maturity dates, plant height, lodging, shattering and green stem ratings at harvest were recorded for one replication. Lodging was rated on a scale of 1 to 5: 1 = most plants erect; 2 = all plants leaning slightly or only a few plants down; 3 = all plants leaning moderately or 25 to 50% of plants down; 4 = all plants leaning considerably with 50 to 80% of plants down; and 5 = all plants down. Green stem was rated on a visual scale of 1 to 5: 1 = complete absence of measure to 5 = maximum value. The maturity date was recorded when all pods were dry. Plant height of 10 consecutive plants, selected at a random spot from one of the center 2 rows, was measured from the soil surface to the upper most extremity in the first replication of each study. All four replications were rated prior to harvest (between R6 and R6.5 depending on variety) for Cercospora leaf blight (CLB) and frogeye leaf spot (FLS) on a scale of 0 to 9: 0 = no observable disease present and 9 = severe disease characterized by the majority of the leaf surface area covered with lesions. Cercospora blight was specifically rated as an additive observation whereby 4-5=symptoms of Cercospora blight only on leaf tissues, 6=purpling of petioles, 7=purpling of petioles and pods, and 8-9=purpling of petioles, stems, and severe purple coloration of pods. In addition, Septoria brown spot and target spot were observed throughout the trials and were rated using a 0 to 9 scale similar to the one outlined above; however, whereby 0 = no disease, 5 = disease in the middle of the canopy and 9 = disease in the upper canopy with severe defoliation.

Each study was harvested when all varieties had matured. The Roundup Ready early MG IV, late MG V, early MG V, and late MG V variety trial studies were harvested 9/21/16, 10/03/16, 10/10/16 and 10/06/16, respectively. The conventional/Liberty-Link MG IV and V studies were harvested 10/03/16 and 10/06/16, respectively. The plot harvest combine was equipped with an on-board electronic weight, test weight and seed moisture recording system. Yield was calculated for the harvested area (6.33 ft × 20 ft) and adjusted to 13% seed moisture. Mean variety yield and disease

ratings in each study were separated using Fisher's Protected Least Significant Difference (LSD) at the 10% significance level and 5% significance level, respectively.

**RESULTS AND DISCUSSION:** Rainfall during the growing season was 4.38, 0.90, 2.81, 0.98, 4.02, and 0.13 inches for April, May, June, July, August, and September, respectively (Table 1). The rainfall amount ranged from 3% for September to 105% of normal for August. Below normal rainfall occurred in April, May, June, July, and September. Only slight lodging and little less than 2% seed shatter were observed at harvest in all studies (data not reported) except the conventional/Liberty-Link MG IV variety study, Roundup Ready early MG IV and the conventional/Liberty-Link MG V study. In the Roundup Ready early MG IV (Table 2), late MG IV (Table 3), and Conventional/Liberty-Link MG V (Table 7), varieties are footnoted that had greater than 2% seed shatter. In Conventional/Liberty-Link MG IV study, the seed shatter ranged from 0 to 58% (Table 6). This year's ratings showed green stem was prevalent in Roundup Ready late MG IV and MG IV conventional/Liberty-Link study (Tables 3 and 6). In both studies, green stem was prevalent in a few varieties.

Twenty-six varieties in the Roundup Ready MG early IV Variety Trial were evaluated (Table 2). The yield ranged from 55.3 to 73.1 bu/ac with an overall mean yield of 65.0 bu/ac. Maturity dates ranged from 9/13/16 to 9/26/16. Plant height at maturity ranged from 32 to 46 inches. The greatest yield was achieved with Asgrow AG4632 producing 73.1 bu/ac. Varieties which were not different in yield from AG4632 were Asgrow AG46X6, Delta Grow DG4670 R2Y, Dyna-Gro S43RY95, NK S42-P6, Dyna-Gro 31RY45, Mycogen 5N452R2, and NK S49-W9.

Thirty-eight varieties in Roundup Ready MG late IV Variety Trial were evaluated (Table 3). Maturity dates ranged from 9/26/16 to 10/01/16. Plant height at maturity ranged from 27 to 44 inches. Yields ranged from 53.2 to 71.0 bu/ac. The greatest yielding variety was Delta Grow DG4790 RR2 with 71.0 bu/ac. Varieties that were not different from DG4790 RR2 were NK S48-D9, Armor 47-R70, Croplan R2C4775, Armor 47-D17, Pioneer 47T89R and NK S47-K5. Green stem ratings ranged from 1 to a 3 using a rating scale of 1 (none present) to 5 (all plants exhibited green stems). Most varieties were rated a 2 with a few rated a 3.

Twenty-six varieties were evaluated in the Roundup Ready MG early V Variety Trial (Table 4). Maturity dates ranged from 9/26/16 to 10/06/16. Plant height at maturity ranged from 27 to 47 inches. The yields ranged from 48.9 to 76.7 bu/ac with an overall mean yield of 63.1 bu/ac. The highest yielding variety was Delta Grow DG5580 RR2 with 76.7 bu/ac yield. This variety was greater in yield than the other varieties.

Five varieties were evaluated in the Roundup Ready MG late V Variety Trial (Table 5). Maturity dates ranged from 10/04/16 to 10/06/16. Plant height at maturity ranged from 21 to 27 inches. The yields ranged from 57.2 to 69.4 bu/ac with an overall mean yield of 64.4 bu/ac. Dyna-Gro S57RY26 was the highest yielding variety with 69.4 bu/ac. Varieties which had yields equal to Dyna-Gro S57RY26 were USG 75B75R and Progeny 5752 RY.

Eighteen varieties were evaluated in the Conventional/Liberty-Link Maturity Group IV Variety Trial (Table 6). The yields ranged from 23.7 to 62.1 bu/ac with an overall mean yield of 52.3 bu/ac. Maturity dates ranged from 9/07/16 to 10/01/16. Plant height at maturity ranged from 22 to 41

inches. The highest yielding variety was Delta Grow DG4781LL with 62.1 bu/ac. Varieties not different in yield from DG 4781LL were Go Soy 4714LL, Progeny P4930LL, Go Soy 4913LL, Delta Grow DG4967 LL, Progeny 4814 LLS, Go Soy 4912LL, Credenz CZ4748 LL, Hornbeck HBK LL 4953, and Delta Grow DG4977 LL/STS. Seed shatter ranged from none to 58%. Green stem ratings ranged from 1 (no plants with green stems) to 3 on a 1 to 5 scale (all plants with green stems). Most varieties had low levels of green stems.

Eighteen varieties were evaluated in the Conventional/Liberty-Link Maturity Group V Variety Trial (Table 7). The yields ranged from 55.9 to 71.6 bu/ac with an overall mean yield of 63.4 bu/ac. Maturity dates ranged from 9/26/16 to 10/05/16. Plant height ranged from 23 to 52 inches. University of Arkansas R09-430 was the highest yielding variety with 71.6 bu/ac. Varieties that were not different from University of Arkansas R09-430 were University of Arkansas UA 5014 C, UA 5213 C, UA 5612 C, Osage, Credenz CZ5150 LL, CZ5147 LL, Go Soy 5115LL and Go Soy 5515LL.

All varieties were rated for the presence of Cercospora leaf blight and frogeye leaf spot. Cercospora blight was present throughout all trials and ranged from 5.0 (present only on leaves) to 7.8 (present on pods, petioles and leaves). Frogeye leaf spot was also present throughout all trials and ranged from 0 (no observable frogeye) to 6.8 (moderate frogeye). Depending on MG Septoria brown spot and target spot were observed throughout the plant canopy; however, observations tended to be in the middle of the canopy (rating of 4-5) for the most part. A lack of resistance in commercially available varieties presents challenges for soybean farmers throughout MS.

These results indicate soybean growers have a good selection of productive varieties to choose from that range in maturity from late August to late September/early October. The most productive varieties' yields ranged from 65.0 to 76.7 bu/ac. The least productive varieties ranged in yield from 23.1 to 55.3 bu/ac. Selection of varieties with the greatest yield potential and appropriate disease resistance is essential for soybean profitability.

Table 1. 2016 Rainfall for Verona, MS.

| Month            | Days of Month     |             |             | Total       | % Normal <sup>1</sup> |

<sup>1</sup>Ratings for CLB (Cercospora blight) and FLS (frogeye leaf spot) were based on a scale whereby 0=no disease and 9=severe disease. CLB was rated based on the presence of disease on leaves (0 to 5), petioles (6), and on pods and stems (7 to 9) based on disease intensity as assessed by coloration of plant material (leaves with distinct purple coloration and petioles, pods and main stems with purple to near black coloration).

<sup>2</sup>Ratings for Septoria (Septoria brown spot) and target spot were based on a scale whereby 0=no disease, 5= disease in the middle of the canopy and 9=disease in the upper canopy with severe defoliation.

<sup>3</sup>Means followed by the same letter(s) within a column are not significantly different according to Fisher's Protected LSD ( $P=0.05$ ).

Table 9. Foliar disease ratings for Roundup Ready Late Maturity Group IV Soybean Variety Trial planted May 16, 2016 on a Leeper silty clay loam soil, Verona, MS.

<sup>1</sup>Ratings for CLB (Cercospora blight) and FLS (frogeye leaf spot) were based on a scale whereby 0=no disease and 9=severe disease. CLB was rated based on the presence of disease on leaves (0 to 5), petioles (6), and on pods and stems (7 to 9) based on disease intensity as assessed by coloration of plant material (leaves with distinct purple coloration and petioles, pods and main stems with purple to near black coloration).

<sup>2</sup>Ratings for Septoria (Septoria brown spot) and target spot were based on a scale whereby 0=no disease, 5=disease in the middle of the canopy and 9=disease in the upper canopy with severe defoliation.

<sup>3</sup>Means followed by the same letter(s) within a column are not significantly different according to Fisher's Protected LSD ( $P=0.05$ ).

Table 10. Foliar disease ratings for Roundup Ready Maturity Group Early V Soybean Variety Trial planted May 16, 2016 on a Leeper silty clay loam soil, Verona, MS.

<sup>1</sup>Ratings for CLB (*Cercospora* blight) and FLS (frog-eye leaf spot) were based on a scale whereby 0=no disease and 9=severe disease. CLB was rated based on the presence of disease on leaves (0 to 5), petioles (6), and on pods and stems (7 to 9) based on disease intensity as assessed by coloration of plant material (leaves with distinct purple coloration and petioles, pods and main stems with purple to near black coloration).

<sup>2</sup>Ratings for Septoria (*Septoria* brown spot) and target spot were based on a scale whereby 0=no disease, 5= disease in the middle of the canopy and 9=disease in the upper canopy with severe defoliation.

<sup>3</sup>Means followed by the same letter(s) within a column are not significantly different according to Fisher's Protected LSD ( $P=0.05$ ).

<sup>1</sup>Ratings for CLB (Cercospora blight) and FLS (frog-eye leaf spot) were based on a scale whereby 0=no disease and 9=severe disease. CLB was rated based on the presence of disease on leaves (0 to 5), petioles (6), and on pods and stems (7 to 9) based on disease intensity as assessed by coloration of plant material (leaves with distinct purple coloration and petioles, pods and main stems with purple to near black coloration).

<sup>2</sup>Ratings for Septoria (Septoria brown spot) and target spot were based on a scale whereby 0=no disease, 5= disease in the middle of the canopy and 9=disease in the upper canopy with severe defoliation.

<sup>3</sup>Means followed by the same letter(s) within a column are not significantly different according to Fisher's Protected LSD ( $P=0.05$ ).
